1.3.2 Classes and Structs

Struct Acc

• Defined in file_esp32_common_IK_datatype.h

Struct Documentation

struct Acc

Public Functions

Acc()

Acc (float min, float max)

Public Members

float min

float max

Struct Constraints

• Defined in file_esp32_common_IK_datatype.h

Struct Documentation

Public Functions Constraints()

Public Members

Pos pos Vel vel

Acc acc

Struct Coords

• Defined in file_esp32_common_IK_datatype.h

Constraints (Pos pos, Vel vel, Acc acc)

Struct Documentation

struct Coords

Public Functions

```
Coords ()
Coords (float x, float y, float phi)
```

Public Members

float x

float y

float **phi**

Struct Deserializer

• Defined in file_arduino_common_serialutils.h

Struct Documentation

struct Deserializer

Objet destiné à extraire des variables d'un flux en octet.

Descrializer permet d'extraire d'un buffer des variables. Cela permet une utilisation plus simple de *SerialTalks*. Voir l'utilisation dans la doc python. Attention a bien extraire les variables dans le bonne ordre pour éviter les problèmes d'encodage et autres.

Public Functions

Deserializer (byte buffer[])

Construct a new Deserializer object.

Parameters

• buffer: The buffer pointer

template<typename T>

```
Deservative & Operator >> (T & object)
```

Operateur de décalage, à utiliser pour extraire les variables du buffer.

Return *Descrializer*& Retourne le pointeur du descrializer pour une utilisation plus simple.

Parameters

• object: bject à complêter avec le buffer. Attention le type de la variable est pris en compte dans la conversion octect -> var

Operateur de décalage, a utilisé pour remplir le buffer uniquement pour les variables de type char.

Return Deserializer & Retourne le pointeur du serializer pour une utilisation plus simple

Parameters

• string: Object a renvoyer dans le buffer pour transmission.

template<typename **T**>

```
T \, {f read} \, (\, )
```

Methode interne pour convertir les octets du buffer en données exploitables.

Return T Retourne la valeur extraite du buffer.

```
void clear()
```

Free the buffer memory.

```
Deserializer (byte buffer[])
```

template<typename **T**>

Deservative & operator >> (T & object)

template<typename T>

 $T \, \mathtt{read}()$

template<>

```
String read()

Deserializer template to a string buffer.

Return String The string buffer

template<>
String read()

Public Members

byte *buffer
pointer vers le buffer à vider

byte *adr
buffer address pointer
```

Struct DetailedPos

• Defined in file_esp32_common_IK_datatype.h

Struct Documentation

```
struct DetailedPos
```

Public Functions

```
DetailedPos()
DetailedPos(Coords origin, Coords link1, Coords link2, Coords tool)
```

Public Members

```
Coords link1
Coords link2
Coords tool
```

Struct Joints

• Defined in file_esp32_common_IK_datatype.h

Struct Documentation

```
struct Joints
```

Public Functions

```
Joints()
Joints (float th1, float th2, float th3)
```

Public Members

float th1

float th2

float th3

Struct Motor_state_t

• Defined in file_esp32_common_IK_MotorWrapper.h

Struct Documentation

```
struct Motor_state_t
```

Public Members

```
uint8_t id
uint8_t timeout
uint8_t err_code
```

Struct MoveCommand_t

• Defined in file_esp32_common_IK_MoveBatch.h

Struct Documentation

```
struct MoveCommand_t
```

Public Members

```
bool isActive
float position
vector<float> vel
vector<float> time
```

Struct path_t

• Defined in file_esp32_common_IK_datatype.h

Struct Documentation

```
struct path_t
```

Public Members

```
vector_t path_th1
vector_t path_th2
vector_t path_th3
Coords pos
```

Struct Polynom

• Defined in file_esp32_common_IK_datatype.h

Struct Documentation

```
struct Polynom
```

Public Functions

```
Polynom() Polynom(float a\theta, float aI, float a2)
```

Public Members

float a0

float a1

float a2

Struct Pos

• Defined in file_esp32_common_IK_datatype.h

Struct Documentation

struct Pos

Public Functions

```
Pos()
```

Pos (float min, float max)

Public Members

float min

float max

Struct Position

• Defined in file_arduino_common_Odometry.h

Struct Documentation

struct Position

Structure de position.

Author Ulysse Darmet *Position* est une structure de Odometry.h qui permet en une variable d'obtenir la totalité des informations à propos du positionnement du robot.

```
Return struct Position {
```

Public Functions

Position()

Constructeur de *Position*. Constructeur de *Position* qui initialise la position au coordonnées (0,0) et à l'angle 0.

Position (float *x*, float *y*, float *theta*)

Constructeur de Position.

Constructeur de *Position* qui initialise la position au coordonnées indiqués.

Parameters

- x: coordoonée en x initial.
- y: coordoonée en y initial.
- theta: angle initial.

```
Position ()

Position (float x, float y, float theta)

Public Members

float x

Coordonnée en x.

float y

Coordonnée en y.

float theta

Angle.
```

Struct PurePursuit::Waypoint

• Defined in file_arduino_common_PurePursuit.h

Nested Relationships

This struct is a nested type of Class PurePursuit.

Struct Documentation

```
struct PurePursuit::Waypoint
    Structure d'un point de passage de Purpursuit.
    struct Waypoint

Public Functions

Waypoint()
Waypoint (float x, float y)
Waypoint (const Position &pos)
Waypoint()
Waypoint (float x, float y)
Waypoint (float x, float y)
Waypoint (const Position &pos)

Public Members
float x
float y
```

Struct Serializer

• Defined in file_arduino_common_serialutils.h

Struct Documentation

struct Serializer

Objet destiné à creer un flux de sortie pour les programme cpp.

Serializer permet de remplir un buffer en octet à l'aide de variable de tous type. Cela permet une utilisation plus simple de SerialTalks. Voir l'utilisation dans la doc python.

Public Functions

```
Serializer(byte buffer[])
```

Construct a new Serializer object.

Parameters

• buffer: pointeur du buffer.

template<typename T>

```
Serializer & operator << (const T & object)
```

Operateur de décalage, a utilisé pour remplir le buffer.

Return Serializer & Retourne le pointeur du serializer pour une utilisation plus simple

Parameters

• object: Objet a renvoyer dans le buffer pour transmission.

```
template<typename T>
```

```
void write (const T &object)
```

Methode pour une utilisation interne qui permet d'écrire sur le buffer après conversion en octets.

Parameters

• object: Object a renvoyer dans le buffer pour ecriture.

```
void write (const char *string)
```

Methode pour une utilisation interne qui permet d'écrire sur le buffer après conversion en octets.

Parameters

• string: Object (sous la forme d'un char) a renvoyer dans le buffer pour ecriture.

```
Serializer (byte buffer[])
template<typename T>
Serializer & Operator<< (const T & Object)
template<typename T>
void write (const T & Object)
void write (const char *string)
template<>
```

```
void write (const String &string)

Serializer template to a string buffer.
```

Parameters

• string: The string buffer

```
template<>
void write (const String &string)
```

Public Members

```
byte *buffer
pointer vers le buffer à complêter
```

Struct SerialTopics::subscription_t

• Defined in file_arduino_common_SerialTopics.h

Nested Relationships

This struct is a nested type of *Class SerialTopics*.

Struct Documentation

```
struct SerialTopics::subscription_t
    Subscription context structure.
```

Public Members

```
Subscription func long timestep long lasttime bool enable
```

Struct TrajectoryTime

• Defined in file_esp32_common_IK_datatype.h

Struct Documentation

struct TrajectoryTime

Public Functions

```
\label{toryTime} \textbf{TrajectoryTime} \ (\ ) \\ \\ \textbf{TrajectoryTime} \ (\ \text{float} \ t1, \ \text{float} \ t2, \ \text{float} \ tf) \\
```

Public Members

float **t1**

float t2

float **tf**

Struct vector_t

• Defined in file_esp32_common_IK_datatype.h

Struct Documentation

```
struct vector_t
```

Public Members

vector<float> t

vector<float> pos

vector<float> vel

vector<float> acc

Struct Vel

• Defined in file_esp32_common_IK_datatype.h

Struct Documentation

struct Vel

Public Functions

```
Vel()
```

Vel (float *min*, float *max*)

Public Members

float min

float max

Struct Workspace

• Defined in file_esp32_common_IK_datatype.h

Struct Documentation

struct Workspace

Public Functions

```
Workspace()
```

Workspace (float *x_min*, float *x_max*, float *y_min*, float *y_max*, int *elbow_or*)

Public Members

float **x_min**

float **x_max**

float y_min

float y_max

float elbow_or

Class AbstractCodewheel

• Defined in file_arduino_common_Odometry.h

Inheritance Relationships

Derived Type

• public Codewheel (Class Codewheel)

Class Documentation

class AbstractCodewheel

Classe abstraite d'une roue codeuse.

Cette classe est à implémenter pour être compatible avec la classe *Odometry*.

Author Ulysse Darmet

Subclassed by Codewheel

Public Functions

```
~AbstractCodewheel()
```

```
float getTraveledDistance() = 0
```

Calcul la distance parcourue.

Méthode à implémenter, dont le rôle est de retourner la distance parcourue depuis le dernier appel de cette méthode (ou depuis l'initialisation de l'objet).

Return Distance parcourue depuis le dernier appel.

```
float restart() = 0
```

Réinitialise l'objet.

Réinitialise l'objet. C'est à dire, repasse tous les paramètres à leur état inital. De plus cette méthode dois retourner la distance parcourue depuis le dernier appel de AbstractCodewheel::getTraveledDistance.

Return Distance parcourue depuis le dernier getter de distance.

```
~AbstractCodewheel()
float getTraveledDistance() = 0
float restart() = 0
```

Class AbstractMotor

• Defined in file arduino common DifferentialController.h

Inheritance Relationships

Derived Type

• public DCMotor (Class DCMotor)

Class Documentation

class AbstractMotor

Instance de moteur.

Author Ulysse Darmet Instance de Moteur permettant une parfaite compatibilitée entre les classes Motor et le *DifferentialController*.

Subclassed by DCMotor

Public Functions

```
~AbstractMotor()
```

Constructeur d'AbstractMotor.

Méthode à implémenter.

```
void setVelocity (float velocity) = 0
```

Charge une nouvelle vitesse.

Change la vitesse du moteur par celle passée en parametre. Méthode à implémenter.

Parameters

• velocity: Nouvelle vitesse.

```
float getMaxVelocity() const = 0
```

Retourne vitesse max.

Retourne la vitesse max du moteur pour son intégration dans les calculs de Differential Controller.

Return virtual float

```
~AbstractMotor()
void setVelocity(float velocity) = 0
float getMaxVelocity() const = 0
```

Class AbstractMoveStrategy

• Defined in file_arduino_common_PositionController.h

Inheritance Relationships

Derived Types

- public PurePursuit (Class PurePursuit)
- public TurnOnTheSpot (Class TurnOnTheSpot)

Class Documentation

class AbstractMoveStrategy

Interface de Stratégie de mouvement.

Interface à implémenter pour réaliser une classe de strategie de mouvement.

Subclassed by PurePursuit, TurnOnTheSpot

Protected Functions

void computeVelSetpoints (float timestep) = 0

Calcul les nouvelles vitesses désirer.

Méthode à implémenter pour réaliser une *AbstractMoveStrategy*. Cette méthode calcul à partir de la position du robot des vitesses à suivre pour le robot.

Parameters

• timestep: Temps depuis le dernier appel en secondes.

bool getPositionReached() = 0

Indique si la position désirée est atteinte.

Calcul la distance entre la position du robot et la position désirée selon le mode de calcul de l'*AbstractMoveStrategy*.

Return true Si la position est atteinte.

Return false Si la position n'est pas atteinte.

const Position &getPosInput() const

Retourne la position du robot.

Retourne la position du robot stocker dans le *PositionController*.

Return La position du robot sous la struct *Position*.

const Position &getPosSetpoint() const

Retourne la position à atteindre.

Return Position à atteindre.

void setVelSetpoints (float linVelSetpoint, float angVelSetpoint)

Charge une nouvelle vitesse pour le robot.

Parameters

- linVelSetpoint: Vitesse linéaire en mm/s.
- angVelSetpoint: Vitesse angulaire en rad/s.

float getLinVelKp() const

Retourne le coef proportionnel de vitesse linéaire.

Return Coefficient proportionnel (sans unité).

float getAngVelKp() const

Retourne le coef proportionnel de vitesse angulaire.

Return Coefficient proportionnel (sans unité).

float getLinVelMax() const

Retourne vitesse linéaire max.

Return Vitesse en mm/s.

float getAngVelMax() const

Retourne vitesse angulaire max.

Return Vitesse en rad/s.

float getLinPosThreshold() const

Retourne la précision cartésienne à atteindre.

Return Précision en mm.

float getAngPosThreshold() const

Retourne la précision angulaire à atteindre.

Return Précision en rad.

```
void computeVelSetpoints (float timestep) = 0
```

bool getPositionReached() = 0

```
const Position &getPosInput() const
```

const Position &getPosSetpoint() const

void setVelSetpoints (float linVelSetpoint, float angVelSetpoint)

float getLinVelKp() const

float getAngVelKp() const

float getLinVelMax() const

float getAngVelMax() const

float getLinPosThreshold() const

float getAngPosThreshold() const

Protected Attributes

PositionController *m_context

Pointeur du PositionControlleur associé.

Friends

friend class PositionController

Class AX12

• Defined in file_arduino_common_AX12_AX12.h

Class Documentation

class AX12

Public Functions

```
void attach (unsigned char id)
void detach()
int ping()
int setID (unsigned char newID)
int setBD (long baud)
int move (float Position)
int moveSpeed (float Position, float Speed)
int setEndlessMode (bool Status)
int turn (int Speed)
int Nextmove (float Position)
int NextmoveSpeed (float Position, float Speed)
int setTempLimit (unsigned char Temperature)
int setAngleLimit (float CWLimit, float CCWLimit)
int setVoltageLimit (unsigned char DVoltage, unsigned char UVoltage)
int setMaxTorque (int MaxTorque)
int setMaxTorqueRAM (int MaxTorque)
int setSRL (unsigned char SRL)
int setRDT (unsigned char RDT)
int setLEDAlarm (unsigned char LEDAlarm)
int setShutdownAlarm (unsigned char SALARM)
int setCMargin (unsigned char CWCMargin, unsigned char CCWCMargin)
int setCSlope (unsigned char CWCSlope, unsigned char CCWCSlope)
int setPunch (int Punch)
int moving()
int lockRegister()
```

```
int savedMove()
int readTemperature()
float readVoltage()
float readPosition()
float readSpeed()
int readTorque()
bool isHolding()
int hold (bool Status)
int led (bool Status)
void attach (unsigned char id)
void detach()
int reset ()
int ping()
int setID (unsigned char newID)
int setBD (long baud)
int move (float Position)
int moveSpeed (float Position, float Speed)
int setEndlessMode (bool Status)
int turn (int Speed)
int Nextmove (float Position)
int NextmoveSpeed (float Position, float Speed)
int setTempLimit (unsigned char Temperature)
int setAngleLimit (float CWLimit, float CCWLimit)
int setVoltageLimit (unsigned char DVoltage, unsigned char UVoltage)
int setMaxTorque (int MaxTorque)
int setMaxTorqueRAM (int MaxTorque)
int setSRL (unsigned char SRL)
int setRDT (unsigned char RDT)
int setLEDAlarm (unsigned char LEDAlarm)
int setShutdownAlarm (unsigned char SALARM)
int setCMargin (unsigned char CWCMargin, unsigned char CCWCMargin)
int setCSlope (unsigned char CWCSlope, unsigned char CCWCSlope)
int setPunch (int Punch)
int moving()
int lockRegister()
int savedMove()
```

```
int readTemperature()
float readVoltage()
float readPosition()
float readSpeed()
int readTorque()
bool isHolding()
int hold (bool Status)
int led (bool Status)

Public Static Functions

void SerialBegin (long baud, unsigned char rx, unsigned char tx, unsigned char control)
void end()
void action()
void SerialBegin (long baud, unsigned char control)
void end()
void action()
```

Class AX12error

• Defined in file_esp32_common_AX12_Dynamixel.h

Class Documentation

class AX12error

Public Functions

```
AX12error (int ID, int error_code)
bool resolve_AX_error()
int get_id() const
int get_error_code() const
```

Class AX12Timeout

• Defined in file_esp32_common_AX12_Dynamixel.h

Class Documentation

```
class AX12Timeout
```

Public Functions

```
AX12Timeout (int id)
int get_id() const
```

Class BrushlessMotor

• Defined in file_arduino_common_BrushlessMotor.h

Inheritance Relationships

Base Type

• public PeriodicProcess (Class PeriodicProcess)

Class Documentation

class BrushlessMotor: public PeriodicProcess

Public Functions

```
BrushlessMotor()
void attach(int PIN)
void detach()
void enableStartup()
void disableStartup()
void updateStartup()
void enableMotor()
void disableMotor()
int setVelocity(int velocity)
int setPulsewidth(int pulsewidth)
void update()
void startupProcess()
```

```
float getVelocity() const
bool isEnabled() const
int readMicroseconds()
```

Protected Functions

```
void process (float timestep)
```

Méthode à implémenter obligatoirement pour hériter de *PeriodicProcess*.

Process est la méthode qui s'exécutera toutes les m_timestep. Il doit donc définir l'action répétitive voulue dans la loop de l'Arduino.

Parameters

• timestep: Temps écoulé depuis le dernier appel en seconde.

Class Clock

• Defined in file_arduino_common_Clock.h

Class Documentation

class Clock

Utilitaire pour gérer le temps dans vos programmes Arduino.

class Clock

Author Ulysse Darmet est un outil permettant à vos programmes d'utiliser plus simplement la méthode micros() de <Arduino.h>. Cette objet vous permettera de mesurer le temps écoulé depuis le dernier appel de la méthode Clock::restart.

Public Functions

```
Clock()
```

Constructeur de Clock.

Le constructeur de *Clock* en plus de construire l'objet fait un premier marqueur qui vous permettra d'utiliser Clock::getElapsedTime pour avoir le temps écoulé depuis la création de l'objet.

float getElapsedTime() const

Récupère le temps depuis le dernier reset.

Récupère le temps écoulé en secondes depuis la construction de l'objet ou depuis le dernier Clock::restart.

Return Temps écoulé en secondes.

```
float restart()
```

Reset le temps.

Réinitialise le temps à 0s.

Return Temps écoulé en secondes depuis le dernier reset.

```
Clock()
```

float getElapsedTime() const

float restart()

Class Codewheel

• Defined in file_arduino_common_Codewheel.h

Inheritance Relationships

Base Types

- private NonCopyable (Class NonCopyable)
- public AbstractCodewheel (Class AbstractCodewheel)

Class Documentation

class Codewheel: private NonCopyable, public AbstractCodewheel

Fait la passerelle entre les roues codeuses et le compteur.

class Codewheel

Author Ulysse Darmet Cette classe permet de récupérer les tics des roues codeuses à travers la puce compteuse.

Public Functions

```
Codewheel()
```

void **attachCounter** (int *XY*, int *AXIS*, int *SEL1*, int *SEL2*, int *OE*, int *RST*) Set les pins pour le compteur.

Parameters

- XY: Voir doc elec
- AXIS: Voir doc elec
- SEL1: Voir doc elec
- SEL2: Voir doc elec
- OE: Voir doc elec
- RST: Voir doc elec

void attachRegister (int DATA, int LATCH, int CLOCK)

Set les pins pour les registres du compteur.

Parameters

- DATA:
- LATCH:
- CLOCK:

long getCounter()

Donne le nombre de tic absolue courant.

Return long Le nombre de tics depuis le dernier reset.

long getCountsPerRev()

Donne le nombre de tics par tour courant.

Return long Nombre de tics par tour.

float getWheelRadius()

Donne le rayon de la roue en mm.

Return float rayon en mm.

void setCountsPerRev (long countsPerRev)

Set le nombre de tics par tour.

Parameters

• countsPerRev: nb de tics par tour.

void setWheelRadius (float wheelRadius)

Set le rayon en mm de la roue.

Parameters

• wheelRadius: rayon en mm.

void reset ()

Réinitialise le compteur à 0.

Cette méthode peut rendre caduque le prochain Codewheel::getTraveledDistance.

float getTraveledDistance()

Donne la distance parcouru.

Cette méthode donne la distance parcouru par la roue depuis le dernier Codewheel::reset ou Codewheel::restart.

Return float

float restart()

Donne la distance parcouru et reset le compteur.

Cette méthode appel la méthode Codewheel::getTravemedDistance avant de mettre à jour le compteur de l'arduino (pas du compteur (puce elec)).

Return float

void load (int address)

Charge les données de l'EEPROM avec l'offset.

Parameters

• address: Offset à utiliser pour lire dans l'EEPROM.

void save (int address)

Sauvegarde les constantes actuelles dans l'EEPROM.

Parameters

• address: Offset à utiliser pour ecrire dans l'EEPROM.

Codewheel ()

void **attachCounter** (int *XY*, int *AXIS*, int *SEL1*, int *SEL2*, int *OE*, int *RST*) Set les pins pour le compteur.

Parameters

- · XY: Voir doc elec
- AXIS: Voir doc elec
- SEL1: Voir doc elec
- SEL2: Voir doc elec
- OE: Voir doc elec
- RST: Voir doc elec

void attachRegister (int DATA, int LATCH, int CLOCK)

Set les pins pour les registres du compteur.

Parameters

- DATA:
- LATCH:
- CLOCK:

long getCounter()

Donne le nombre de tic absolue courant.

Return long Le nombre de tics depuis le dernier reset.

long getCountsPerRev()

Donne le nombre de tics par tour courant.

Return long Nombre de tics par tour.

float getWheelRadius()

Donne le rayon de la roue en mm.

Return float rayon en mm.

void setCountsPerRev (long countsPerRev)

Set le nombre de tics par tour.

Parameters

• countsPerRev: nb de tics par tour.

void setWheelRadius (float wheelRadius)

Set le rayon en mm de la roue.

Parameters

• wheelRadius: rayon en mm.

void reset()

Réinitialise le compteur à 0.

Cette méthode peut rendre caduque le prochain Codewheel::getTraveledDistance.

float getTraveledDistance()

Donne la distance parcouru.

Cette méthode donne la distance parcouru par la roue depuis le dernier Codewheel::reset ou Codewheel::restart.

Return float

float restart ()

Donne la distance parcouru et reset le compteur.

Cette méthode appel la méthode Codewheel::getTravemedDistance avant de mettre à jour le compteur de l'arduino (pas du compteur (puce elec)).

Return float

void load (int address)

Charge les données de l'EEPROM avec l'offset.

Parameters

• address: Offset à utiliser pour lire dans l'EEPROM.

void save (int address) const

Sauvegarde les constantes actuelles dans l'EEPROM.

Parameters

• address: Offset à utiliser pour ecrire dans l'EEPROM.

Protected Functions

void update()

Récupère le nombre de tics stoqués dans le compteur.

void update()

Récupère le nombre de tics stoqués dans le compteur.

Protected Attributes

$long \ m_currentCounter$

Tic courant.

long m startCounter

Tic depuis le dernier reset.

$float \ m_wheelRadius$

Rayon de la roue codeuse en mm.

long m_countsPerRev

Nombre de tics par tour de roue.

int m_COUNTER_XY

Select one of the two quad counters. See below.

```
int m COUNTER AXIS
    Not a pin: X = 0, Y = 0.
int m COUNTER SEL1
    MSB = 0, 2ND = 1, 3RD = 0, LSB = 1.
int m COUNTER SEL2
    MSB = 0, 2ND = 0, 3RD = 1, LSB = 1.
int m COUNTER OE
    Active LOW. Enable the tri-states output buffers.
int m_COUNTER_RST
     Active LOW. Clear the internal position counter and the position latch.
int m_REGISTER_DATA
    Serial data input from the 74HC165 register.
int m_REGISTER_LATCH
    Active LOW. Latch signal for the 74HC165 register.
int m REGISTER CLOCK
    LOW-to-HIGH edge-triggered. Clock signal for the 74HC165 register.
```

Class CRC16

• Defined in file_arduino_common_CRC16.h

Class Documentation

class CRC16

Public Functions

```
CRC16()
uint16_t CRCprocessByte (uint8_t data)
uint16_t CRCprocessBuffer (const uint8_t *data_p, int length)
bool CRCcheck (uint8_t *data_p, uint16_t length, uint16_t crc)
CRC16()
uint16_t CRCprocessByte (uint8_t data)
uint16_t CRCprocessBuffer (const uint8_t *data_p, uint16_t length)
bool CRCcheck (uint8_t *data_p, uint16_t length, uint16_t crc)
```

Class DCMotor

• Defined in file_arduino_common_DCMotor.h

Inheritance Relationships

Base Types

- private NonCopyable (Class NonCopyable)
- public AbstractMotor (Class AbstractMotor)

Class Documentation

class DCMotor: private NonCopyable, public AbstractMotor

Pilotage de moteur continu.

class *DCMotor* Remarque : Pour les moteurs qui ne sont reliées à des roues seulement régler la constante du moteur à 1/tension_PWM. Ainsi, on peut simplement controler le moteur via setVelocity() en envoyant comme commande la tension de PWM souhaitée.

Author Ulysse Darmet Cette classe permet de contrôler un moteur à courant continu par PWM via un driver Moteur

Public Functions

DCMotor()

void attach (int EN, int PWM, int DIR)

Indique quels pins de l'arduino son utilisé pour ce moteur (actuellement correspond à moteur 1 ou 2)

void setVelocity (float velocity)

Envoie une commande de vitesse au moteur.

Parameters

• velocity: vitesse de commande en mm/s

void setConstant (float constant)

Paramètre la constante du moteur.

Parameters

• constant: constante en rad/s/Volt

void setWheelRadius (float wheelRadius)

Paramètre le rayon de la roue liée au moteur.

Parameters

 \bullet wheelRadius: rayon en mm

void **setMaxPWM** (float *maxPWM*)

Paramètre une valeur limite de PWN à ne pas dépasser.

Parameters

void enable()

• maxPWM: valeur limite entre 0 et 1

```
void disable()
float getVelocity() const
```

Renvoie la vitesse de commande actuelle du moteur.

Return vitesse en mm/s

float getConstant() const

Renvoie la constante du moteur paramétrée.

Return constante: (60 * reduction_ratio / velocity_constant_in_RPM) / supplied_voltage_in_V

float getWheelRadius() const

Renvoie rayon de la roue du moteur.

float getMaxPWM() const

Renvoie la valeur max de PWM.

Return valeur entre 0 et 1

```
bool isEnabled() const
```

float getMaxVelocity() const

Renvoie la vitesse maximale avec les constantes actuelles.

Return vitesse max en mm/s

```
void load (int address)
void save (int address) const
```

void attach (int EN, int PWM, int PWMChanel, int freq, int DIR)

Indique quels pins de l'arduino son utilisé pour ce moteur (actuellement correspond à moteur 1 ou 2)

void setVelocity (float velocity)

Envoie une commande de vitesse au moteur.

Parameters

DCMotor()

• velocity: vitesse de commande en mm/s

void setConstant (float constant)

Paramètre la constante du moteur.

Parameters

• constant: constante en rad/s/Volt

void setWheelRadius (float wheelRadius)

Paramètre le rayon de la roue liée au moteur.

Parameters

• wheelRadius: rayon en mm

void **setMaxPWM** (float *maxPWM*)

Paramètre une valeur limite de PWN à ne pas dépasser.

Parameters

• maxPWM: valeur limite entre 0 et 1

```
void enable()
```

```
void disable()
```

float getVelocity() const

Renvoie la vitesse de commande actuelle du moteur.

Return vitesse en mm/s

float getConstant() const

Renvoie la constante du moteur paramétrée.

Return constante: (60 * reduction_ratio / velocity_constant_in_RPM) / supplied_voltage_in_V

float getWheelRadius() const

Renvoie rayon de la roue du moteur.

float getMaxPWM() const

Renvoie la valeur max de PWM.

Return valeur entre 0 et 1

```
bool isEnabled() const
```

float getMaxVelocity() const

Renvoie la vitesse maximale avec les constantes actuelles.

Return vitesse max en mm/s

```
void load (int address)
```

void save (int address) const

Protected Functions

```
void update()
```

void update()

Protected Attributes

```
bool m_enabled

float m_velocity
    in mm/s (millimeters per second)

float m_wheelRadius
    in mm

float m_constant
    (60 * reduction_ratio / velocity_constant_in_RPM) / supplied_voltage_in_V

float m_maxPWM
    in range ]0, 1]

int m_EN

int m_PWM

int m_DIR

Mutex m_mutex

int m_PWMChanel
```

Class DCMotorsDriver

• Defined in file_arduino_common_DCMotor.h

Class Documentation

class DCMotorsDriver

Utilisation des drivers moteurs.

class DCMotorsDriver

Author Ulysse Darmet est une classe permettant d'utiliser les fonctions du driver

Public Functions

```
Définit les pins utiles au driver.

Parameters

• RESET: pin de reset

• FAULT: pin de Fault

void reset ()

bool isFaulty()
```

void **attach** (int *RESET*, int *FAULT*)
Définit les pins utiles au driver.

void attach (int RESET, int FAULT)

Parameters

```
    RESET: pin de reset
    FAULT: pin de Fault
    void reset ()
    bool isFaulty ()
```

Class DifferentialController

• Defined in file_arduino_common_DifferentialController.h

Inheritance Relationships

Base Type

• public PeriodicProcess (Class PeriodicProcess)

Derived Type

• public VelocityController (Class VelocityController)

Class Documentation

class DifferentialController: public PeriodicProcess

Controle les moteurs.

DifferentialController permet de controler les deux moteurs du robot à partir de l'odométrie et d'un PID.

Subclassed by VelocityController

Public Functions

${\tt DifferentialController}\,(\,)$

Constructeur de *DifferentialController* Constructeur de *DifferentialController* qui initialise les variables à des valeurs neutres.

void setInputs (float linInput, float angInput)

Charge les vitesses actuel.

Charge les vitesses instantanées du robot pour l'asservissemeent.

Parameters

- linInput: Vitesse linéaire en mm/s.
- angInput: Vitesse angulaire en rad/s.

void setSetpoints (float linSetpoint, float angSetpoint)

Charge les vitesses désirées.

Charge la vitesse désirée par l'utilisation.

Parameters

- linSetpoint: Vitesse linéaire en mm/s.
- angSetpoint: Vitesse angulaire en rad/s.

void setAxleTrack (float axleTrack)

Charge l'entraxe.

Charge l'entraxe entre les deux roues du robot. Attention: cette entraxe est différente que celle du de l'odométrie.

Parameters

• axleTrack:

void setWheels (AbstractMotor &leftWheel, AbstractMotor &rightWheel)

Charge les moteurs.

Charge les pointeurs de AbstractMotor du DifferentialController.

Parameters

- leftWheel: Roue gauche (AbstractMotor).
- rightWheel: Roue droite (AbstractMotor).

void setPID (PID &linPID, PID &angPID)

Charge l'asservissement.

Charge les pointeurs PID pour l'asservissement de DifferentialController.

Parameters

- linPID: Asservissement linéaire.
- angPID: Asservissement angulaire.

float getLinSetpoint() const

Retourne la vitesse demandée.

Return float Vitesse linéaire en mm/s.

float getAngSetpoint() const

Retourne la vitesse demandée.

Return float Vitesse angulaire en rad/s.

float getLinOutput() const

Retour la commande linéaire actuel.

Return float Commande linéaire en mm/s

Retour la commande angulaire actuel.

Return float Commande angulaire en rad/s

float getAxleTrack() const

Retourne l'entraxe.

```
Return Entraxe en mm.
```

```
void load (int address)
```

Charge les paramètres.

Charge les paramètres depuis la mémoire de l'Arduino.

Parameters

• address: Adresse à utiliser.

void save (int address) const

Sauvegarde les paramètres.

Sauvegarde les paramètres dans la mémoire de l'Arduino.

Parameters

• address: Adresse à utiliser.

```
DifferentialController()
```

```
void setInputs (float linInput, float angInput)
void setSetpoints (float linSetpoint, float angSetpoint)
void setAxleTrack (float axleTrack)
void setWheels (AbstractMotor &leftWheel, AbstractMotor &rightWheel)
void setPID (PID &linPID, PID &angPID)
float getLinSetpoint () const
float getAngSetpoint () const
float getAngOutput () const
float getAngOutput () const
float getAxleTrack () const
```

Protected Functions

void load (int address)

```
void process (float timestep)
```

Calcul l'asservissement

void save (int address) const

Parameters

• timestep: Temps depuis le dernier appel.

void onProcessEnabling()

Reset les accumulateurs des asserv.

void process (float timestep)

Méthode à implémenter obligatoirement pour hériter de PeriodicProcess.

Process est la méthode qui s'exécutera toutes les m_timestep. Il doit donc définir l'action répétitive voulue dans la loop de l'Arduino.

Parameters

• timestep: Temps écoulé depuis le dernier appel en seconde.

void onProcessEnabling()

Méthode exécutée à l'activation du PeriodicProcess.

Méthode à implémenter si votre class nécessite des actions à son activation.

Protected Attributes

float m_linInput

Vitesse linéaire actuel du robot.

float m_angInput

Vitesse angulaire actuel du robot.

float m_linSetpoint

Vitesse linéaire demandée (en mm/s).

float m_angSetpoint

Vitesse angulaire demandée (en rad/s).

float m_axleTrack

Entraxe entre les deux roues motrices du robot (en mm).

float m_linVelOutput

Vitesse linéaire asservie.

float m_angVelOutput

Vitesse angiulaire asservie.

AbstractMotor *m_leftWheel

Pointeur du moteur gauche (AbstractMotor).

AbstractMotor *m_rightWheel

Pointeur du moteur droit (AbstractMotor).

PID *m_linPID

Pointeur de l'asservissement linéaire.

PID *m_angPID

Pointeur de l'asservissement angulaire.

Mutex m_mutex

Class DynamixelClass

```

Class EndStop

• Defined in file_arduino_common_EndStop.h

Class Documentation

class EndStop

Capteur fin de course est une classe permettant d'utiliser les capteurs fins de courses (clic de souris/bouton poussoir) Pour utiliser cette classe le bouton doit être d'un côté relié à la masse et de l'autre à l'arduino.

class EndStop

Public Functions

```
bool getState()
Permet de connaitre l'état courant du bouton.

Return etat (1 si enfoncé, 0 sinon).

void attach (int pin)
Indique le pin de l'arduino utilisé.

void detach()
Réciproque de attach.
```

Class FullSpeedServo

• Defined in file_arduino_common_FullSpeedServo.h

Inheritance Relationships

Base Type

• public PeriodicProcess (Class PeriodicProcess)

Class Documentation

class FullSpeedServo : public PeriodicProcess

Pilotage de Servomoteur particulier.

class *FullSpeedServo* Cette classe permet de controler un Servomoteur comme un moteur continu avec une butée Cela veut dire faire tourner un servomoteur dans une direction pendant un certain temps.

Public Functions

```
void SpeedWrite (int setpoint, float time)
```

Fait tourner le servomoteur pendant le temps donné ou jusqu'à la position demandée.

Parameters

- setpoint: position de commande
- time: durée en secondes

void write (int setpoint)

Fait tourner le servomoteur jusqu'à la position demandée (vitesse normale)

Parameters

• setpoint: position de commande

void attach (int pin)

Définit le pin sur lequel est connecté le serovmoteur.

Parameters

• pin: de l'arduino

void detach()

Fonction réciproque de *attach()* (permet par exemple d'avoir un servomoteur en roue libre)

bool attached()

Permet de savoir si le servo est attaché ou pas (respectivement maintient sa position / roue libre)

Return renvoie 1 si attached et 0 si detached

int read()

renvoie la dernière position envoyée au servo (seulement si le servo est "attached")

Return position du Servo entier

Protected Functions

```
void process (float timestep)
```

Méthode à implémenter obligatoirement pour hériter de *PeriodicProcess*.

Process est la méthode qui s'exécutera toutes les m_timestep. Il doit donc définir l'action répétitive voulue dans la loop de l'Arduino.

Parameters

• timestep: Temps écoulé depuis le dernier appel en seconde.

Class ArmManager

Subclassed by Codewheel, DCMotor

Protected Functions

```
NonCopyable()
```

NonCopyable()

Class Odometry

• Defined in file_arduino_common_Odometry.h

Inheritance Relationships

Base Type

• public PeriodicProcess (Class PeriodicProcess)

Class Documentation

class Odometry: public PeriodicProcess

Calcule la position en temps réel du robot.

Author Ulysse Darmet *Odometry* est un *PeriodicProcess* qui calcule la position du robot à partir des roues codeuses (*AbstractCodewheel*) .

Public Functions

```
void setPosition (float x, float y, float theta)
```

Attribut une nouvelle position.

A partir des coordonnées passer en paramètre, attribut les nouvelles coordonnées à sa Position.

Parameters

- x: Nouvelle coordonnée en x.
- y: Nouvelle coordonnée en y.

• theta: Nouvelle angle.

void setAxleTrack (float axleTrack)

Defini une nouvelle entraxe pour les roues codeuses.

Change l'entraxe actuel par celui indiqué en paramètre.

Parameters

• axleTrack: Nouvelle entraxe en mm.

void setSlippage (float slippage)

Defini la nouvelle dérive orthogonal.

Change la dérive orthogonal par celle indiquée en paramètre.

Parameters

• slippage: Nouvelle dérive orthogonal sans unité et signé.

void **setCodewheels** (AbstractCodewheel &leftCodewheel, AbstractCodewheel &rightCodewheel) Defini les roues codeuses de Odometry.

Paramètre les pointeurs sur les deux AbstractCodewheel à utiliser pour le calcul d'odométrie.

Parameters

- leftCodewheel: *AbstractCodewheel* de la roue codeuse gauche.
- rightCodewheel: AbstractCodewheel de la roue codeuse droite.

const Position &getPosition() const

Retourne la position.

Retourne sa struc *Position* avec les dernières positions calculés.

Return La structure Position.

float getLinVel() const

Retourne la vitesse linéaire.

Rend la dernière vitesse linéaire calculé.

Return Vitesse lineaire en mm/s.

float getAngVel() const

Retourne la vitesse angulaire.

Rend la dernière vitesse angulaire calculé.

Return Vitesse angulaire en rad/s.

float getAxleTrack() const

Retourne l'entraxe utilisée.

Return Entraxe en mm.

float getSlippage() const

Retourne la dérive utilisée.

Return Dérive sans unité.

void **load** (int *address*)

Charge les paramètres.

Charge les paramètres depuis la mémoire de l'arduino.

Parameters

• address: Adresse à utilisé pour charger les données.

void save (int address) const

Sauvegarde les paramètres.

Sauvegarde les paramètres actuelement utilisés.

Parameters

• address: Adresse à utilisé pour la sauvegarde.

```
void setPosition (float x, float y, float theta)
void setAxleTrack (float axleTrack)
void setSlippage (float slippage)
void setCodewheels (AbstractCodewheel &leftCodewheel, AbstractCodewheel &rightCodewheel)
const Position getPosition() const
float getLinVel() const
float getAngVel() const
float getAxleTrack() const
float getSlippage() const
void load (int address)
void save (int address) const
```

Protected Functions

void process (float timestep)

Calcule la nouvelle position et la nouvelle vitesse. A partir de ses *AbstractCodewheel*, détermine la nouvelle vitesse instantanée et la nouvelle position.

Parameters

• timestep: Temps depuis le dernier appel de cette méthode en secondes.

void process (float timestep)

Méthode à implémenter obligatoirement pour hériter de *PeriodicProcess*.

Process est la méthode qui s'exécutera toutes les m_timestep. Il doit donc définir l'action répétitive voulue dans la loop de l'Arduino.

Parameters

• timestep: Temps écoulé depuis le dernier appel en seconde.

Protected Attributes

Position m_pos

Structure de position de *Odometry*.

float m_linVel

Vitesse lineaire en mm/s.

float m_angVel

Vitesse angulaire en rad/s.

float m_axleTrack

Entraxe entre les deux roues codeuses.

float m_slippage

Constante de dérivation othogonal.

AbstractCodewheel *m_leftCodewheel

Pointeur de l'AbstractCodewheel gauche.

AbstractCodewheel *m_rightCodewheel

Pointeur de l'AbstractCodewheel droite.

Mutex m_mutex

Class PeriodicProcess

• Defined in file_arduino_common_PeriodicProcess.h

Inheritance Relationships

Derived Types

- public BrushlessMotor (Class BrushlessMotor)
- public DifferentialController (Class DifferentialController)
- public FullSpeedServo (Class FullSpeedServo)
- public IK::MotorWrapper (Class MotorWrapper)
- public IK::TrajectoryManager (Class TrajectoryManager)
- public Odometry (Class Odometry)
- public PositionController (Class PositionController)
- public VelocityControllerLogs (Class VelocityControllerLogs)

Class Documentation

class PeriodicProcess

Classe à implémenter pour gérer les appels dans la loop.

class *PeriodicProcess* est un outil permettant à l'Arduino de pouvoir appeler l'objet *PeriodicProcess* tout les X s. Cela permet de ne pas saturer le microcontroleur pour des tâches qui ne nécessitent pas un très gros rafraichissement. En général, on l'utilise pour toutes les tâches dans la loop.

Par exemple : faire tourner un moteur pendant un certain temps puis l'arreter en autonomie sans delay()

Subclassed by BrushlessMotor, DifferentialController, FullSpeedServo, IK::MotorWrapper, IK::TrajectoryManager, Odometry, PositionController, VelocityControllerLogs

Public Functions

~PeriodicProcess()

Constructeur de PeriodicProcess.

Le constructeur est totalement vide.

void enable()

Active le *PeriodicProcess*.

Passe la variable m_enable à Vrai et execute onProcessEnabling.

void disable()

Désactive le *PeriodicProcess*.

Passe la variable m_enable à Faux et execute onProcessDisabling.

void setTimestep (float timestep)

Sélectionne une nouvelle valeur pour timestep.

Change le timestep par celui donné en paramètre.

Parameters

• timestep: Temps en secondes du taux de rafraichissement.

bool update()

Execute la méthode process.

Execute la méthode process si le temps passé est supérieur à timestep. Envoie à process le temps depuis le dernier appel.

Return Vrai si process a été lancé et Faux sinon.

bool isEnabled() const

Vérifie si le *PeriodicProcess* est activé.

Return La valeur de m enabled.

float getTimestep() const

Retourne la valeur de m_timestep.

Return La valeur de m_timestep.

~PeriodicProcess()

```
void enable()
void disable()
void setTimestep(float timestep)
bool update()
bool isEnabled() const
float getTimestep() const
```

Protected Functions

```
void process (float timestep) = 0
```

Méthode à implémenter obligatoirement pour hériter de *PeriodicProcess*.

Process est la méthode qui s'exécutera toutes les m_timestep. Il doit donc définir l'action répétitive voulue dans la loop de l'Arduino.

Parameters

• timestep: Temps écoulé depuis le dernier appel en seconde.

void onProcessEnabling()

Méthode exécutée à l'activation du *PeriodicProcess*.

Méthode à implémenter si votre class nécessite des actions à son activation.

void onProcessDisabling()

Méthode exécutée à la désactivation du PeriodicProcess.

Méthode à implémenter si votre class nécessite des actions à sa déactivation.

```
void process (float timestep) = 0
void onProcessEnabling()
void onProcessDisabling()
```

Class PID

• Defined in file_arduino_common_PID.h

Class Documentation

class PID

Classe d'asservissement.

Author Ulysse Darmet *PID* est une classe d'asservissement composée des 3 types d'asservissements. Elle permet à partir de l'erreur et de la constante désiré de retourner une commande asservie.

Public Functions

PID()

Constructeur de *PID* Constructeur de *PID* qui initialise toutes les valeurs à des valeurs neutres (Kp=1,Ki=0,Kd=0).

float compute (float setpoint, float input, float timestep)

Calcul l'asservissement.

A partir de l'erreur et du temps depuis le dernier appel et de la constante demandé, rend une consigne asservie.

Return float La valeur asservie.

Parameters

- setpoint: Constante désiré.
- input: Constante actuel.
- timestep: Temps depuis le dernier appel en secondes.

void reset ()

Réinitialise les accumulateurs.

void **setTunings** (float *Kp*, float *Ki*, float *Kd*)

Charge de nouvelles constantes d'asservissements.

Parameters

- Kp: Coefficient proportionnel.
- Ki: Coefficient intégrateur.
- Kd: Coefficient dérivateur.

void **setOutputLimits** (float *minOutput*, float *maxOutput*)

Charge les limites de sorties.

Parameters

- minOutput: Minimun de sortie (peux être négatif).
- maxOutput: Maximum de sortie (peux être).

float getKp() const

Retourne le coefficient proportionnel.

Return Coefficient proportionnel.

float getKi() const

Retourne le coefficient intégrateur.

Return Coefficient intégrateur.

float getKd() const

Retourne le coefficient dérivateur.

Return Coefficient dérivateur.

float getMinOutput() const

Retourne la sortie minimal.

Return Sortie minimal.

float getMaxOutput() const

Retourne la sortie maximal.

Return Sortie maximal.

void load (int address)

Charge les paramètres de la mémoire.

Parameters

• address: Adresse à utiliser.

void save (int address) const

Sauvegarde les paramètres dans la mémoire.

Parameters

• address: Adresse à utiliser.

PID()

Constructeur de *PID* Constructeur de *PID* qui initialise toutes les valeurs à des valeurs neutres (Kp=1,Ki=0,Kd=0).

float compute (float setpoint, float input, float timestep)

Calcul l'asservissement.

A partir de l'erreur et du temps depuis le dernier appel et de la constante demandé, rend une consigne asservie.

Return float La valeur asservie.

Parameters

- setpoint: Constante désiré.
- input: Constante actuel.
- timestep: Temps depuis le dernier appel en secondes.

void reset ()

Réinitialise les accumulateurs.

void **setTunings** (float *Kp*, float *Ki*, float *Kd*)

Charge de nouvelles constantes d'asservissements.

Parameters

- Kp: Coefficient proportionnel.
- Ki: Coefficient intégrateur.
- Kd: Coefficient dérivateur.

void setOutputLimits (float minOutput, float maxOutput)

Charge les limites de sorties.

Parameters

- minOutput: Minimun de sortie (peux être négatif).
- maxOutput: Maximum de sortie (peux être).

float getKp() const

Retourne le coefficient proportionnel.

Return Coefficient proportionnel.

float getKi() const

Retourne le coefficient intégrateur.

Return Coefficient intégrateur.

float getKd() const

Retourne le coefficient dérivateur.

Return Coefficient dérivateur.

float getMinOutput() const

Retourne la sortie minimal.

Return Sortie minimal.

float getMaxOutput() const

Retourne la sortie maximal.

Return Sortie maximal.

void load (int address)

Charge les paramètres de la mémoire.

Parameters

• address: Adresse à utiliser.

void save (int address) const

Sauvegarde les paramètres dans la mémoire.

Parameters

• address: Adresse à utiliser.

Class PositionController

• Defined in file_arduino_common_PositionController.h

Inheritance Relationships

Base Type

• public PeriodicProcess (Class PeriodicProcess)

Class Documentation

class PositionController: public PeriodicProcess

Classe support des objets *AbstractMoveStrategy*.

PositionController est le support des AbstractMoveStrategy. C'est à dire qu'il permet de charger ou supprimer une stratégie. Quand PositionController execute une stratégie de mouvement, il va l'executé tous les time_steps pour y obtenir de nouvelles vitesses à suivre. PositionConstroller va également renseigné la position du robot à AbstractMoveStrategy chargée.

Return class *PositionController*: public *PeriodicProcess* { public:

Public Functions

PositionController()

Constructeur de PositionController Initialise les variables de PositionController à des valeurs neutre.

void setPosInput (const Position &posInput)

Charge les nouvelles positions du robot. Charge les nouvelles positions du robot pour les donner à une potentiel *AbstractMoveStrategy* chargée.

Parameters

• posInput: Nouvelle objet *Position* représentant la position du robot.

void setPosSetpoint (const Position &posSetpoint)

Charge la position à atteindre.

Charge la position à atteindre avec une *AbstractMoveStrategy*. Cette variable est potentiellement utilisé par l'*AbstractMoveStrategy*.

Parameters

• posSetpoint: Position à atteindre

void setThetaSetpoint (float theta)

Charge l'angle à atteindre.

Change l'angle objectif de l'objet *Position*. Remarque : les coordonnées objectif reste les mêmes.

Parameters

• theta: Nouvelle angle objectif.

float getLinVelSetpoint() const

Retourne la vitesse linéaire à atteindre.

Cette méthode retourne la vitesse linéaire que l'AbstractMoveStrategy souhaite atteindre.

Return Vitesse à atteindre en mm/s.

float getAngVelSetpoint() const

Retourne la vitesse angulaire à atteindre.

Cette méthode retourne la vitesse angulaire que l'AbstractMoveStrategy souhaite atteindre.

Return Vitesse angulaire à atteindre en rad/s.

void **setVelTunings** (float *linVelKp*, float *angVelKp*)

Paramètre les coéfficients linéaire.

Paramètre de nouvelles valeurs pour les coefficients linéaire de vitesse et vitesse de rotation. Ces coefficients seront appliqués lors du calcul de vitesses à atteindre.

Parameters

- linVelKp: Coefficient proportionnel de vitesse linéaire.
- angVelKp: Coefficient proportionnel de vitesse angulaire.

void **setVelLimits** (float *linVelMax*, float *angVelMax*)

Paramètre les vitesses max.

Paramètre des vitesses maximals qui dois être appliquer à l'AbstractMoveStrategy.

Parameters

- linVelMax: Vitesse linéaire max.
- angVelMax: Vitesse angulaire max.

void setPosThresholds (float linPosThreshold, float angPosThreshold)

Paramètre les précisions en position.

Paramètre les valeurs de précision pour l'*AbstractMoveStrategy*. Si l'erreur de position est inférieur, l' *AbstractMoveStrategy* est arrêté.

Parameters

- linPosThreshold: Précision en coordonnés cartésiens (en mm).
- angPosThreshold: Précision d'angle (en rad).

$void \ \textbf{setMoveStrategy} \ (\textit{AbstractMoveStrategy} \ \& moveStrategy)$

Charge une stratégie de mouvement.

Charge la stratégie de mouvement (*AbstractMoveStrategy*) passée en paramètre. Elle sera active après l'activation de *PositionController* (PositionController::enable).

Parameters

• moveStrategy: AbstractMoveStrategy à utiliser.

bool getPositionReached()

Indique si la position est atteinte.

Permet de savoir si la position objectif est atteinte avec la précision souhaitée.

Return true Position atteinte.

Return false *Position* non atteinte.

float getLinVelKp() const

Retourne le coef proportionnel de vitesse linéaire.

Return Coefficient proportionnel (sans unité).

float getAngVelKp() const

Retourne le coef proportionnel de vitesse angulaire.

Return Coefficient proportionnel (sans unité).

float getLinVelMax() const

Retourne la vitesse max linéaire.

Return Vitesse max en mm/s.

float getAngVelMax() const

Retourne la vitesse max angulaire.

Return Vitesse angulaire max en rad/s.

float getLinPosThreshold() const

Retourne la précision cartésienne.

Return Précision cartésienne en mm.

float getAngPosThreshold() const

Retourne la précision angulaire.

Return Précision angulaire en rad.

void load (int address)

Charge les configs.

Charge les configurations de la mémoire de l'Arduino avec l'adresse indiqué en paramètre.

Parameters

• address: Adresse à utiliser.

void save (int address) const

Sauvegarde la configuration actuel.

Parameters

• address: Adresse à utiliser.

```
PositionController()
```

```
void setPosInput (const Position &posInput)
```

void setPosSetpoint (const Position &posSetpoint)

void setThetaSetpoint (float theta)

float getLinVelSetpoint() const

Class PressureSensor

• Defined in file_esp32_common_PressureSensor_PressureSensor.h

Class Documentation

class PressureSensor

Public Functions

```
PressureSensor (int analogPin)
int getPressurekPa()
bool currentlyAtmospherePressure()
void change_pressure_threshold(float threshold)
float get_pressure_threshold()
```

Class PurePursuit

• Defined in file_arduino_common_PurePursuit.h

Nested Relationships

Nested Types

• Struct PurePursuit::Waypoint

Inheritance Relationships

Base Type

• public AbstractMoveStrategy (Class AbstractMoveStrategy)

Class Documentation

```
class PurePursuit: public AbstractMoveStrategy Trajectoire courbe le long d'une ligne brisée.
```

class PurePursuit est un AbstractMoveStrategy.

Public Types

enum Direction

Sens de déplacement pour le robot.

enum Direction

Values:

enumerator FORWARD = 1

Le robot avance en marche avant.

enumerator BACKWARD = -1

Le robot avance en marche arrière.

enumerator FORWARD = 1

Le robot avance en marche avant.

enumerator BACKWARD = -1

Le robot avance en marche arrière.

enum Direction

Values:

enumerator FORWARD = 1

Le robot avance en marche avant.

enumerator BACKWARD = -1

Le robot avance en marche arrière.

enumerator FORWARD = 1

Le robot avance en marche avant.

enumerator BACKWARD = -1

Le robot avance en marche arrière.

Public Functions

PurePursuit()

void setDirection (Direction direction)

Setter du sens de marche du robot.

Parameters

• direction: Sens à utiliser pour le déplacement du robot.

void setFinalAngle (float finalAngle)

Setter de l'angle à atteindre en fin de trajectoire.

Parameters

• finalAngle: Angle à atteindre (entre l'axe du robot et l'axe des x)

bool addWaypoint (const Waypoint &waypoint)

Ajout un point en fin de ligne brisée.

Return true Ajout réussi.

Return false L'ajout a rencontré un problème.

Parameters

• waypoint: Nouveau point à ajouter.

void reset()

Initialise le Purpuisuit. Supprime les points de la ligne brisée et les paramètres temporaires.

void setLookAhead (float lookAhead)

Setter du lookAhead.

Met à jour la distance entre le point intermediaire et le robot.

Parameters

• lookAhead: Distance en mm.

void setLookAheadBis (float lookAheadBis)

Setter du lookAheadBis.

Met à jour la distance entre le point intermediaire et le robot en fin de trajectoire.

Parameters

• lookAheadBis: Distance en mm.

Direction getDirection() const

Getter de la direction courant.

Return Direction Sens utilisé.

float getFinalAngle() const

Getter de l'angle final.

Retourne l'angle final que le robot va atteindre en fin de trajectoire.

Return float Angle final en rad.

const Waypoint &getWaypoint (int index) const

Getter d'un point de passage.

Retourne le point de passage sous la forme d'un Waypoint. L'index permet d'identifier le point à retourner.

Return Waypoint & Point de passage demandé.

Parameters

• index: Numéro du point à retourner.

int getNumWaypoints() const

Getter du nombre de point de passage.

Return int Nombre de points de la ligne brisée.

float getLookAhead() const

Getter du lookahead.

Return float LookaHead en mm.

float getLookAheadBis() const

Getter du LookAHead de fin de trajectoire.

Return float LookaHeadbis en mm.

void load (int address)

Charge les paramètres sauvegardés.

Parameters

• address: Adresse à utiliser.

void save (int address) const

Sauvegarde les paramètres actuels.

Parameters

• address: Adresse à utiliser.

PurePursuit()

```
void setDirection (Direction direction)
```

void setFinalAngle (float finalAngle)

bool addWaypoint (const Waypoint &waypoint)

void reset()

void **setLookAhead** (float *lookAhead*)

void setLookAheadBis (float lookAheadBis)

Direction getDirection() const

float getFinalAngle() const

const Waypoint &getWaypoint (int index) const

```
int getNumWaypoints() const
float getLookAhead() const
float getLookAheadBis() const
void load(int address)
void save(int address) const
```

Protected Functions

void computeVelSetpoints (float timestep)

Calcul les nouvelles vitesses désirer.

Méthode à implémenter pour réaliser une *AbstractMoveStrategy*. Cette méthode calcul à partir de la position du robot des vitesses à suivre pour le robot.

Parameters

• timestep: Temps depuis le dernier appel en secondes.

bool getPositionReached()

Indique si la position désirée est atteinte.

Calcul la distance entre la position du robot et la position désirée selon le mode de calcul de l'*AbstractMoveStrategy*.

Return true Si la position est atteinte.

Return false Si la position n'est pas atteinte.

bool checkLookAheadGoal (const float x, const float y)

Calcul le point intermediaire sur la ligne brisée.

Calcul le point intermediaire sur la courbe et met à jour le segment courant.

Return true Un point a été trouvé.

Return false Aucun point n'a été trouvé.

Parameters

- x: Coordonnées x du robot (mm).
- y: Coordonnées y du robot (mm).

void checkProjectionGoal (const float x, const float y)

Calcule le point intermediaire sur la ligne brisée.

Calcule le point le plus près du robot sur la ligne brisée non parcouru.

Parameters

- x: Coordonnées x du robot (mm).
- y: Coordonnées y du robot (mm).

float getDistAfterGoal()

Retourne la distance restante à parcourir.

Return float Distance en mm à parcourir.

void computeVelSetpoints (float timestep)

Calcul les nouvelles vitesses désirer.

Méthode à implémenter pour réaliser une *AbstractMoveStrategy*. Cette méthode calcul à partir de la position du robot des vitesses à suivre pour le robot.

Parameters

• timestep: Temps depuis le dernier appel en secondes.

bool getPositionReached()

Indique si la position désirée est atteinte.

Calcul la distance entre la position du robot et la position désirée selon le mode de calcul de l'*AbstractMoveStrategy*.

Return true Si la position est atteinte.

Return false Si la position n'est pas atteinte.

```
bool checkLookAheadGoal (const float x, const float y)
```

void checkProjectionGoal (const float x, const float y)

float getDistAfterGoal()

Protected Attributes

Waypoint m_waypoints[16]

Liste des points de la ligne brisée à suivre.

int m_numWaypoints

Nombre de points constituant la ligne brisée.

Direction m_direction

Sens du robot pendant la trajectoire.

float m_finalAngle

Angle à atteindre en fin de trajectoire.

int m_goalIndex

Index courant.

float m_goalParam

Position relative de la projection du robot sur le segment courant.

bool m_goalReached

Arrivé ou non.

float m lookAhead

Distance entre le point intermediaire et le robot.

float m_lookAheadBis

Distance entre le point intermediaire et le robot en fin de trajectoire.

struct Waypoint

Structure d'un point de passage de Purpursuit.

struct Waypoint

Public Functions

```
Waypoint()
Waypoint(float x, float y)
Waypoint(const Position &pos)
Waypoint()
Waypoint(float x, float y)
Waypoint(const Position &pos)
Public Members
float x
```

Class Semaphore

Semaphore (int init_val, int max_val)
bool acquire (int wait_time = -1) const
bool release() const
```

Class SerialTalks

• Defined in file_arduino_common_SerialTalks.h

Nested Relationships

Nested Types

• Class SerialTalks::ostream

Class Documentation

class SerialTalks

Object de communication serial avec un ordinateur.

class SerialTalks

Author Ulysse Darmet

Author François Gauthier-Clerc est un outil permettant à l'arduino de pouvoir répondre aux requêtes recu depuis le serial. Il utilise donc le port serial (usb) pour envoyer ou recevoir des données avec l'ordinateur ou la raspberry La classe est capable de lancer des methodes sur demande de l'ordinateur ou de la raspberry.

Public Types

typedef void (*Instruction) (SerialTalks &inst, Deserializer &input, Serializer &output)

Instruction est un pointeur de fonction dont la signature doit être de la forme : (SerialTalks& inst, Deserializer& input, Serializer& output).

typedef void (*Processing) (SerialTalks &inst, Deserializer &input)

Processing est un pointeur de fonction dont la signature doit être de la forme : (*SerialTalks*& inst, *Deserializer*& input). Cette méthode sera appelée après que la raspberry traitera la requête de l'arduino.

typedef void (*Instruction) (SerialTalks &inst, Deserializer &input, Serializer &output)

typedef void (*Processing) (SerialTalks &inst, Deserializer &input)

Public Functions

void begin (Stream &stream)

Initialise le SerialTalks avec un Stream d'<arduino.h>.

Parameters

• stream: Flux à associer pour la communication de *SerialTalks*.

void bind (byte opcode, Instruction instruction)

Associe une Instruction à un OPCODE.

Parameters

- opcode: Code à associer à la fonction.
- instruction: Fonction à répertorier dans SerialTalks.

void attach (byte opcode, Processing processing)

Associe une fonction au retour de la requête de l'OPCODE.

Parameters

- opcode: Code à associer à la fonction.
- instruction: Fonction à répertorier dans SerialTalks.

bool execinstruction (byte *inputBuffer)

Lance la fonction à partir des octets reçus. La méthode lit l'OPCode et transmet à la bonne fonction l'objet *Deserializer* avec le reste les octets reçu non traités et un Serialiser pour la réponse à transmettre.

Return Vrai si la fonction à renvoyé des informations.

Parameters

• inputBuffer: Liste des octets reçus pour cette requête.

bool execute()

Lit les octets reçus et les traites quand ils forment une requête complête.

Return Vrai si une requête à renvoyé une information.

Serializer getSerializer()

Récupère le *Serializer* pour le remplir avant l'appel de la méthode SerialTalks::send.

Return Serializer à remplir.

int send (byte opcode, Serializer output)

Lance la requête avec les données chargées dans le Serializer et l'OPCODE.

Return int Nombre d'octet envoyés.

Parameters

- opcode: Code à utiliser pour le requête vers la Raspeberry.
- output: Serializer à utiliser pour récuperer les données.

bool isConnected() const

Indique si le stream de SerialTalks est bien connecté.

Return Vrai si le stream est connecté.

bool waitUntilConnected (float timeout = -1)

Méthode bloquante jusqu'a la connexion du Stream ou jusqu'au timeout.

Return Vrai si le Stream est connecté.

Parameters

• timeout: Timeout pour la méthode

$bool\ \texttt{getUUID}\ (char\ *uuid)$

Ecrit sur le pointeur l'UUID enregistré dans l'EEPROM de l'Arduino.

Return Vrai si il existe bien un UUID.

Parameters

• uuid: Pointeur à utiliser.

void setUUID (const char *uuid)

Enregistre l'UUID dans l'EEPROM de l'Arduino.

Parameters

• uuid: Pointeur de l'UUID à enregistrer.

void begin (Stream &stream)

```
void bind (byte opcode, Instruction instruction)
void attach (byte opcode, Processing processing)
bool execinstruction (byte *inputBuffer)
bool execute()
Serializer getSerializer()
int send (byte opcode, Serializer output)
bool isConnected() const
bool waitUntilConnected (float timeout = -1)
bool getUUID (char *uuid)
void setUUID (const char *uuid)
Public Members
ostream out
    Flux virtuel pour les STD:OUT.
ostream err
    Flux virtuel pour les STD:ERR ou erreur.
Public Static Functions
void generateRandomUUID (char *uuid, int length)
    Génère un UUID.
    Parameters
          • uuid: Pointeur pour renvoyer l'UUID.
          • length: Longueur en octet de l'UUID à générer.
void generateRandomUUID (char *uuid, int length)
Protected Types
enum [anonymous]
    Values:
    enumerator SERIALTALKS_WAITING_STATE
        En attente de l'arrivé d'un octet.
    enumerator SERIALTALKS_INSTRUCTION_STARTING_STATE
        En attente du prochain octet de la requête correspondant à la taille de celle-ci.
    enumerator SERIALTALKS_CRC_RECIEVING_STATE
        En attente du hash d'intégrité.
    enumerator SERIALTALKS_INSTRUCTION_RECEIVING_STATE
        Réception des derniers octet de la requête.
```

enum [anonymous]

Différents états de réception.

Values:

enumerator SERIALTALKS ORDER

Requête reçu de la raspberry.

enumerator SERIALTALKS_RETURN

Retour de requête.

enum [anonymous]

Values:

enumerator SERIALTALKS WAITING STATE

En attente de l'arrivé d'un octet.

enumerator SERIALTALKS_INSTRUCTION_STARTING_STATE

En attente du prochain octet de la requête correspondant à la taille de celle-ci.

enumerator SERIALTALKS_CRC_RECIEVING_STATE

En attente du hash d'intégrité.

enumerator SERIALTALKS_INSTRUCTION_RECEIVING_STATE

Réception des derniers octet de la requête.

enum [anonymous]

Values:

enumerator SERIALTALKS_ORDER

Requête reçu de la raspberry.

enumerator SERIALTALKS_RETURN

Retour de requête.

Protected Functions

```
int sendback (long retcode, const byte *buffer, int size)
```

```
bool receive (byte *inputBuffer)
```

Méthode interme pour traiter les retours de requêtes.

Return true

Return false

Parameters

• inputBuffer:

```
int sendback (long retcode, const byte *buffer, int size)
```

bool receive (byte *inputBuffer)

Protected Attributes

Stream *m stream

Stream de communication utilisé par SerialTalks.

bool m_connected

Représente l'état de connection.

Instruction m_instructions[0x20]

Listes des instructions enregistrées avec un OPCode associé.

Processing m_processings[0x4]

byte m inputBuffer[64]

Listes des instructions de retour enregistrées avec un OPCode associé. Buffer d'entrée d'informations.

byte m_outputBuffer[64]

Buffer de sortie d'informations.

```
enum SerialTalks::[anonymous] m_state
```

enum SerialTalks::[anonymous] m_order

Différents états de réception.

$byte \ m_bytesNumber$

Type de requête reçu.

Variable pour la réception de données qui correspond à la longueur de la requête en bytes (valeur donnée dans le deuxième byte d'une requête).

byte m_bytesCounter

Variable d'incrementation pour la réception de données.

long m_lastTime

Timeout pour la réception d'octets d'une même requête.

```
unsigned long m_lastRetcode
```

```
CRC16 m_crc
```

byte m_crcBytesCounter

uint16_t received_crc_value

```
byte m_crc_tab[2+1]
```

byte m_crc_tmp[64]

enum SerialTalks::[anonymous] m_state

enum SerialTalks::[anonymous] m_order

Mutex m_mutex

class ostream: public Print

Stream virtuel pour les erreurs et autre. est un outils pour permettre de mieux transmettre les erreurs rencontrées et les STD::OUT.

class ostream

Public Functions

```
size_t write (uint8_t)
```

Ecrit sur le serial l'octet indiqué.

Return Nombre d'octet transmit.

Parameters

• c: octet à passer dans le serial.

```
size_t write (const uint8_t *buffer, size_t size)
```

Ecrit sur le serial le buffer indiqué (liste d'octets).

Return Nombre d'octet transmit.

Parameters

- buffer: à passer.
- size: (taille) du buffer.

template<typename T>

```
ostream &operator<< (const T &object)</pre>
```

Surcharge de l'opérateur '<<'. Cette méthode permet de passer plus facilement les objets dans le serial avec conversion en octets automatique.

Parameters

• object: à passer dans le serial.

```
size_t write (uint8_t)
```

```
size_t write (const uint8_t *buffer, size_t size)
```

```
template<typename T>
```

ostream &operator<<(const T &object)</pre>

Protected Functions

```
void begin (SerialTalks &parent, long retcode)
```

Initialise le ostream. C'est à dire expliciter le pointeur du SerialTalks et le retcode à associer.

Parameters

- parent: SerialTalks à associer.
- retcode: Code d'identification à utiliser pour l'utilisation du serial.

void begin (SerialTalks &parent, long retcode)

Protected Attributes

SerialTalks *m_parent

SerialTalks parent

$long \; \textbf{m_retcode}$

RetCode à associer au flux virtuel

Friends

class ostream

Public Functions

```
size_t write (uint8_t)
```

Ecrit sur le serial l'octet indiqué.

Return Nombre d'octet transmit.

Parameters

• c: octet à passer dans le serial.

```
size_t write (const uint8_t *buffer, size_t size)
```

Ecrit sur le serial le buffer indiqué (liste d'octets).

Return Nombre d'octet transmit.

Parameters

- buffer: à passer.
- size: (taille) du buffer.

template<typename **T**>

```
ostream &operator<<(const T &object)</pre>
```

Surcharge de l'opérateur '<<'. Cette méthode permet de passer plus facilement les objets dans le serial avec conversion en octets automatique.

Parameters

• object: à passer dans le serial.

```
size_t write (uint8_t)
size_t write (const uint8_t *buffer, size_t size)
template<typename T>
ostream &operator<< (const T &object)</pre>
```

Protected Functions

```
void begin (SerialTalks &parent, long retcode)
```

Initialise le ostream. C'est à dire expliciter le pointeur du SerialTalks et le retcode à associer.

Parameters

- parent: SerialTalks à associer.
- retcode: Code d'identification à utiliser pour l'utilisation du serial.

void begin (SerialTalks &parent, long retcode)

Protected Attributes

```
SerialTalks *m_parent
SerialTalks parent
```

long m_retcode

RetCode à associer au flux virtuel

```

Public Functions

```
void begin (SerialTalks &talks)
```

begin topics with serialtalks instance This function bind manage instruction and configure all topics by default

Parameters

• talks: SerialTalks instance

void bind (byte opcode, Subscription subscription)

Call bind function to associate custom topic at desired opcode.

Parameters

- opcode:
- subscription:

bool execute()

function called at each loop iteration. This function check context for each topic and execute it when timeout occur.

Return true

Return false

```
subscription_t *getSubscriptions()
void begin (SerialTalks &talks)
void bind (byte opcode, Subscription subscription)
bool execute()
subscription_t *getSubscriptions()
struct subscription_t
Subscription context structure.

Class Documentation

```
class TurnOnTheSpot: public AbstractMoveStrategy
Rotation du robot sans translations.

Class TurOnTheSpot

Public Types

enum Direction
Values:
```

enumerator TRIG = 1
enumerator CLOCK = -1

Public Functions

TurnOnTheSpot()

void setDirection (Direction direction)

Protected Functions

void computeVelSetpoints (float timestep)

Calcul les nouvelles vitesses désirer.

Méthode à implémenter pour réaliser une *AbstractMoveStrategy*. Cette méthode calcul à partir de la position du robot des vitesses à suivre pour le robot.

Parameters

• timestep: Temps depuis le dernier appel en secondes.

bool getPositionReached()

Indique si la position désirée est atteinte.

Calcul la distance entre la position du robot et la position désirée selon le mode de calcul de l'*AbstractMoveStrategy*.

Return true Si la position est atteinte.

Return false Si la position n'est pas atteinte.

void computeVelSetpoints (float timestep)

Calcul les nouvelles vitesses désirer.

Méthode à implémenter pour réaliser une *AbstractMoveStrategy*. Cette méthode calcul à partir de la position du robot des vitesses à suivre pour le robot.

Parameters

• timestep: Temps depuis le dernier appel en secondes.

bool getPositionReached()

Indique si la position désirée est atteinte.

Calcul la distance entre la position du robot et la position désirée selon le mode de calcul de l'*AbstractMoveStrategy*.

Return true Si la position est atteinte.

Return false Si la position n'est pas atteinte.

Class Documentation

${\tt class\ VelocityController:public} \ {\it Differential Controller}$

Objet de controle de la vitesse.

VelocityController est une version améliorée de *DifferentialController* car il rajoute la gestion de Spin et les accélérations capées.

Public Functions

VelocityController()

Constructeur de VelocityController.

Construteur de Velocity Controller qui initialise ces vairables sur des valeurs neutres.

void **setMaxAngAcc** (float *maxAngAcc*)

Paramètre les accélérations max.

Parameters

- maxLinAcc: Accélération linéaire en mm/s².
- maxAngAcc: Accélération angulaire en rad/s².

```
void setMaxLinAcc (float maxLinAcc)
```

void setMaxLinDec (float maxLinDec)

Paramètre les décéleration max.

Parameters

- maxLinDec: Décélération linéaire en mm/s².
- maxAngDec: Décélération angulaire en rad/s².

```
void setMaxAngDec (float maxAngDec)
```

void setSpinShutdown (bool spinShutdown)

Change l'état de l'arret d'urgence.

Parameters

• spinShutdown: Etat à appliquer à la variable spinShutdown.

float getMaxLinAcc() const

Retourne l'accélération max linéaire.

Return Accélération en mm/s².

float getMaxAngAcc() const

Retourne l'accélération max angulaire.

Return Accélération en rad/s².

float getMaxLinDec() const

Retourne la décélération max linéaire.

Return Décélération en mm/s².

float getMaxAngDec() const

Retourne la décélération max angulaire.

Return Décélération en rad/s².

float getLinSpinGoal() const

float getAngSpinGoal() const

bool getSpinShutdown() const

Retourne l'état de spinShutDown.

Return true Si le robot est bloqué par un obstacle.

Return false Si le robot n'est pas bloqué.

void load (int address)

Charge les paramètres.

Charge les derniers paramètres sauvegarder (les acc et dec) dans l'Arduino.

Parameters

• address: Adresse à utiliser.

void save (int address) const

Sauvegarde les paramètres.

Sauvegarde les paramètres actuellement chargés.

Parameters

• address: Adresse à utiliser.

VelocityController()

Constructeur de VelocityController.

Construteur de Velocity Controller qui initialise ces vairables sur des valeurs neutres.

void setMaxAngAcc (float maxAngAcc)

Paramètre les accélérations max.

Parameters

- maxLinAcc: Accélération linéaire en mm/s².
- maxAngAcc: Accélération angulaire en rad/s².

```
void setMaxLinAcc (float maxLinAcc)
```

void setMaxLinDec (float maxLinDec)

Paramètre les décéleration max.

Parameters

- maxLinDec: Décélération linéaire en mm/s².
- maxAngDec: Décélération angulaire en rad/s².

```
void setMaxAngDec (float maxAngDec)
```

void setSpinShutdown (bool spinShutdown)

Change l'état de l'arret d'urgence.

Parameters

• spinShutdown: Etat à appliquer à la variable spinShutdown.

float getMaxLinAcc() const

Retourne l'accélération max linéaire.

Return Accélération en mm/s².

float getMaxAngAcc() const

Retourne l'accélération max angulaire.

Return Accélération en rad/s².

float getMaxLinDec() const

Retourne la décélération max linéaire.

Return Décélération en mm/s².

float getMaxAngDec() const

Retourne la décélération max angulaire.

Return Décélération en rad/s².

float getLinSpinGoal() const

float getAngSpinGoal() const

bool getSpinShutdown() const

Retourne l'état de spinShutDown.

Return true Si le robot est bloqué par un obstacle.

Return false Si le robot n'est pas bloqué.

void load (int address)

Charge les paramètres.

Charge les derniers paramètres sauvegarder (les acc et dec) dans l'Arduino.

Parameters

• address: Adresse à utiliser.

void save (int address) const

Sauvegarde les paramètres.

Sauvegarde les paramètres actuellement chargés.

Parameters

• address: Adresse à utiliser.

Protected Functions

float **genRampSetpoint** (float *stepSetpoint*, float *input*, float *rampSetpoint*, float *maxAcc*, float *maxDec*, float *timestep*)

Calcul la vitesse à atteindre.

Calcul les nouvelles vitesse à atteindre pour respecter les contraites d'accélérations.

Return float Nouvelle vitesse intermédiaire.

Parameters

- stepSetpoint: Vitesse demandé.
- input: Vitesse actuel
- rampSetpoint: Ancienne vitesse intermédiaire calculée.
- maxAcc: Accélération max.
- maxDec: Accélération min.
- timestep: Temps depuis le dernier appel.

void process (float timestep)

Calcul l'asservissement.

Parameters

• timestep: temps depuis le dernier appel.

void onProcessEnabling()

Initialisation de l'asservissement.

float **genRampSetpoint** (float *stepSetpoint*, float *input*, float *rampSetpoint*, float *maxAcc*, float *maxDec*, float *timestep*)

Calcul la vitesse à atteindre.

Calcul les nouvelles vitesse à atteindre pour respecter les contraites d'accélérations.

Return float Nouvelle vitesse intermédiaire.

Parameters

- stepSetpoint: Vitesse demandé.
- input: Vitesse actuel
- rampSetpoint: Ancienne vitesse intermédiaire calculée.
- maxAcc: Accélération max.
- maxDec: Accélération min.
- timestep: Temps depuis le dernier appel.

void process (float timestep)

Calcul l'asservissement.

Parameters

• timestep: temps depuis le dernier appel.

void onProcessEnabling()

Initialisation de l'asservissement.

Protected Attributes

float m_rampLinVelSetpoint

Vitesse linéaire intermédiaire en mm/s.

float m_rampAngVelSetpoint

Vitesse angulaire intermédiaire en rad/s.

float m_maxLinAcc

Accélération max linéaire en mm/s². Toujours positif.

float m_maxLinDec

Accélération max angulaire en rad/s². Toujours positif.

float $m_maxAngAcc$

Décélération max linéaire en mm/s². Toujours positif.

float m_maxAngDec

Décélération max angulaire en rad/s². Toujours positif.

$bool \ m_spinShutdown$

Etat de la sécurité de patinage.

```
float m_linSpinGoal
float m_angSpinGoal
```

Friends

friend class VelocityControllerLogs

Class VelocityControllerLogs

• Defined in file_esp32_common_VelocityController_VelocityController.h

Inheritance Relationships

Base Type

• public PeriodicProcess (Class PeriodicProcess)

Class Documentation

${\tt class\ VelocityControllerLogs: public} \ {\it PeriodicProcess}$

Classe d'enregistrement de vitesse.

Public Functions

void setController (const VelocityController &controller)

Protected Functions

void process (float timestep)

Méthode à implémenter obligatoirement pour hériter de *PeriodicProcess*.

Process est la méthode qui s'exécutera toutes les m_timestep. Il doit donc définir l'action répétitive voulue dans la loop de l'Arduino.

Parameters

• timestep: Temps écoulé depuis le dernier appel en seconde.

Protected Attributes

```
const VelocityController *m_controller
```

Mutex m_mutex

1.3.3 **Enums**

Enum ax_error_t

• Defined in file_esp32_common_AX12_Dynamixel.h

Enum Documentation

```
enum ax_error_t
    Values:
    enumerator INPUT_VOLTAGE = 1
    enumerator ANGLE_LIMIT = 2
    enumerator OVERHEATING = 4
    enumerator RANGE = 8
    enumerator CHECKSUM = 16
    enumerator OVERLOAD = 32
    enumerator INSTRUCTION = 64
```

1.3.4 Functions

Function float_equals

• Defined in file_esp32_common_IK_ArmManager.cpp

Function Documentation

```
bool IK::float_equals (float a, float b, float epsilon = 0.001)
```

Function IK::equals

• Defined in file_esp32_common_IK_Picker.cpp

Function Documentation

```
bool IK::equals (float a, float b, float epsilon = EPSILON)
```

Function IK::float_equals

• Defined in file_esp32_common_IK_MotorWrapper.cpp

Function Documentation

```
bool IK::float_equals (float a, float b, float epsilon = 0.001)
```

Template Function IK::operator<<(ostream&, const vector<T>&)

Function inrange(float, float, float)

• Defined in file_arduino_common_mathutils.cpp

Function Documentation

float inrange (float x, float min, float max)

Projet la variable x dans l'intervale min, max.

Cette fonction est très utile pour projeter des angles sur -pi / pi par exemple.

Return float Valeur bornée sur l'intervalle.

Parameters

- x: Variable à projeter sur un intervalle.
- min: Valeur basse de l'intervalle.
- max: Valeur haute de l'intervalle.

Function inrange(float, float, float)

• Defined in file_esp32_common_mathutils_mathutils.cpp

Function Documentation

float inrange (float x, float min, float max)

Projet la variable x dans l'intervale min, max.

Cette fonction est très utile pour projeter des angles sur -pi / pi par exemple.

Return float Valeur bornée sur l'intervalle.

Parameters

- x: Variable à projeter sur un intervalle.
- min: Valeur basse de l'intervalle.
- max: Valeur haute de l'intervalle.

Function inrange(float, float, float)

• Defined in file_esp32_common_mathutils_mathutils.h

Function Documentation

```
float inrange (float x, float min, float max)
```

Projet la variable x dans l'intervale min, max.

Cette fonction est très utile pour projeter des angles sur -pi / pi par exemple.

Return float Valeur bornée sur l'intervalle.

Parameters

- x: Variable à projeter sur un intervalle.
- min: Valeur basse de l'intervalle.
- max: Valeur haute de l'intervalle.

Function periodicmod(float, float)

• Defined in file_arduino_common_mathutils.cpp

Function Documentation

```
float periodicmod (float x, float y)

Applique un modulo.
```

Return float

Parameters

- x:
- y:

Function periodicmod(float, float)

• Defined in file_esp32_common_mathutils_mathutils.cpp

Function Documentation

```
float periodicmod(float x, float y)
```

Applique un modulo.

Return float

Parameters

- x:
- y:

Function periodicmod(float, float)

• Defined in file_esp32_common_mathutils_mathutils.h

Function Documentation

```
float periodicmod (float x, float y)

Applique un modulo.
```

Return float

Parameters

- x:
- y:

Function saturate(float, float, float)

• Defined in file_arduino_common_mathutils.cpp

Function Documentation

```
float saturate (float x, float min, float max)
```

Borne la variable x entre les bornes.

Return float Valeur plaquée sur l'intervalle.

Parameters

- x: Variable à plaquer sur un intervalle.
- min: Valeur basse de l'intervalle.
- max: Valeur haute de l'intervalle.

Function saturate(float, float, float)

• Defined in file_esp32_common_mathutils_mathutils.cpp

Function Documentation

float saturate (float x, float min, float max)

Borne la variable x entre les bornes.

Return float Valeur plaquée sur l'intervalle.

Parameters

- x: Variable à plaquer sur un intervalle.
- min: Valeur basse de l'intervalle.
- max: Valeur haute de l'intervalle.

Function saturate(float, float, float)

• Defined in file_esp32_common_mathutils_mathutils.h

Function Documentation

float **saturate** (float *x*, float *min*, float *max*)

Borne la variable x entre les bornes.

Return float Valeur plaquée sur l'intervalle.

Parameters

- x: Variable à plaquer sur un intervalle.
- min: Valeur basse de l'intervalle.
- max: Valeur haute de l'intervalle.

Function shiftInSlow

• Defined in file_esp32_common_Codewheel_Codewheel.cpp

Function Documentation

Warning: doxygenfunction: Cannot find function "shiftInSlow" in doxygen xml output for project "My Project" from directory: ./doxyoutput/xml

Function sign(float)

• Defined in file_arduino_common_mathutils.cpp

Function Documentation

float sign(float x)

Retourne l'information du signe.

Return float 1 pour une variable positif -1 pour une négatif et 0 pour une variable nul (=0).

Parameters

• x: Variable à extraire le signe

Function sign(float)

• Defined in file_esp32_common_mathutils_mathutils.cpp

Function Documentation

float sign(float x)

Retourne l'information du signe.

Return float 1 pour une variable positif -1 pour une négatif et 0 pour une variable nul (=0).

Parameters

• x: Variable à extraire le signe

Function sign(float)

• Defined in file_esp32_common_mathutils_mathutils.h

Function Documentation

float sign(float x)

Retourne l'information du signe.

Return float 1 pour une variable positif -1 pour une négatif et 0 pour une variable nul (=0).

Parameters

• x: Variable à extraire le signe
